

# Dummy Project Presentation

Congratulations! You've mastered all the assignments, survived listening to Dave talk for hours on end, and your dummy project is the mark of perfection. Now it's time to show off your pièce de résistance!

Your presentation will have two parts. The first part is information about your dummy project. The second part is the demonstration; starting with a clone of your dummy project's git repository into an empty directory.

## Requirements

### Time

There is no minimum time requirement. Please try to keep the full presentation to less than 30 minutes. Be prepared for questions at the end.

### Part 1 - Information

- Title of your project
- Summary of your project
- Core features; include if any were not completed
- Stretch features; include if any were implemented
- How your features fulfilled the requirements given by Dave
- What works
- What doesn't work
- Lessons learned and what you'd do differently

### Part 2 - Demonstration

- Checkout dummy project code from repository into an empty directory
- Configure, if necessary, newly checked out code
- Populate your database if it takes less than 2 minutes. If it takes longer than 2 minutes, then have an abbreviated dataset to ingest into the database to show how data gets into your database. With an abbreviated data ingest, you may also prepare (read: populated prior to demo) a fully populated database to use in the live demo.
- Execute application
  - Demo all features
  - Show what doesn't work
